

Subject: *Information Systems Analysis and Design*.....
1301386

Instructors: Dr.Waref Al Manaseer,
I.Asma Almousa

PLEASE NOTE THAT THIS PROJECT IS WITH A TOTAL OF 15 POINTS.

This document serves as a comprehensive guide for your project. It outlines the description, requirements, and important instructions for your project.

PROJECT DESCRIPTION

This project aims to apply the principles and methodologies of Information Systems Analysis and Design to develop a small-scale software system that solves real-life problems. You are required to select a domain of interest (e.g., education, healthcare, business, hospitality, logistics, or government) and propose an information system that improves efficiency, accuracy, or user experience within that context. Your proposed system must include and clearly model **at least six functional requirements**. The system must go through all development phases up to design — including problem analysis, requirements specification, use-case modeling, and system design diagrams.

PROJECT REQUIREMENTS

Each student is required to complete and submit a comprehensive project report that applies the concepts of Information Systems Analysis and Design. The report must be written using the official course project template and include all required chapters, diagrams, and descriptions. Students should also design basic user interface mockups and ensure that all documentation is clear, organized, and follows the structure outlined below.

Students must submit a report that includes the following:

1. **Cover Page**
 - Project title, student name(s) & ID number(s).
2. **Chapter 1: Introduction**
 - Description of the current situation and opportunity.
 - Problem statement identifying current limitations.
 - Proposed solution and system overview.
 - Project objectives.

Chapter 2: Requirements and Analysis

- Software process model used (e.g., Waterfall, Agile, Iterative).
- List of Functional and Non-Functional Requirements.
- Use Case Diagram and Use Case Descriptions.
- Data Flow Diagram (DFD) showing system data movement.
- Activity Diagram describing the flow of main operations.
- System Sequence Diagram (SSD) for at least one main process.

Chapter 3: Design

- Conceptual Class Diagram (UML format).

3. Appendix: User Interface Design

- Basic UI wireframes or screen sketches for main system pages (e.g., login, dashboard, report screen).

4. Formatting and Submission

- Typed using the official template in Word format.
- Clear section headings and consistent formatting.
- All diagrams must be labeled and captioned.
- All diagrams should be created using **Visual Paradigm**.
- Submit electronically by the announced deadline.

Good Luck with your project!
